Learning Module 6 Linear Dynamic Analysis

Dynamic mechanical analysis (abbreviated DMA, also known as dynamic mechanical spectroscopy) is a technique used to study and characterize materials. It is most useful for studying the viscoelastic behavior of polymers. A sinusoidal stress is applied and the strain in the material is measured, allowing one to determine the complex modulus. The temperature of the sample or the frequency of the ...

Euler's Bernoulli beam theory (also known as engineer's beam theory or classical beam theory) is a simplification of the linear theory of elasticity which provides a means of calculating the load-carrying and deflection characteristics of beams. It covers the case for small deflections of a beam that are subjected to lateral loads only. It is thus a special case of Timoshenko beam theory.

A magnetostrictive bioinspired whisker sensor based on a galphenol/beryllium-bronze/galphenol composite cantilever beam was developed in this work. According to the new design concept, the proposed whisker can output positive and negative voltages under different bending directions. Besides, the proposed whisker sensor can realize the bidirectional distance and microforce perception.

Reliable structures, very precise drawings. CYPECAD was brought about to carry out the analysis and design of reinforced concrete and steel structures, subject to horizontal and vertical forces, for houses, buildings and civil work projects.. Its use guarantees maximum analysis reliability and the best drawing design, including the following elements:

CYPE 3D allows users to define shells. Shells are flat two-dimensional elements with constant thickness and without openings, whose perimeter is defined by a polygon. Shells are introduced in the global stiffness matrix of the structure using a three-dimensional finite element model composed of six-node (quadratic) triangular flat shells.

Continuous systems. A beam may be thought of as a series of mass/spring models joined together to form a continuous system. Unlike the SDOF system, which has a single natural frequency and corresponding mode of vibration, a continuous system theoretically has an infinite number of natural frequencies and associated modes.

You can dynamically increase or decrease the Displacement Scale of deformed models by clicking Scale in the Dynamic Rotation toolbar (shown) and holding the left mouse button while moving the mouse: up to increase and down to decrease the displacement scale. When an appropriate scaling factor is obtained, click OK.
