), and facilitation of donor cell insertion into the perivitelline space with laser lesion of zona pellucida (Figure 1A–1F). Clear spindle-like structure was detected after the fusion of the fetal monkey fibroblast with the enucleated oocyte (Figures 1G and S1A). About 1–2 hr after the fusion, reconstructed oocytes were activated with ionomycin and 6-dimethylaminopurine (I/D).

Programmed cell death (or PCD) is the death of a cell in any form, mediated by an intracellular program. PCD is carried out in a biological process, which usually confers advantage during an organism's life-cycle. For example, the differentiation of fingers and toes in a developing human embryo occurs because cells between the fingers apoptose; the result is that the digits are separate.

The cell nucleus contains the majority of the cell's genetic material in the form of multiple linear DNA molecules organized into structures called chromosomes. Each human cell contains roughly two meters of DNA.
